

Expandable Section View

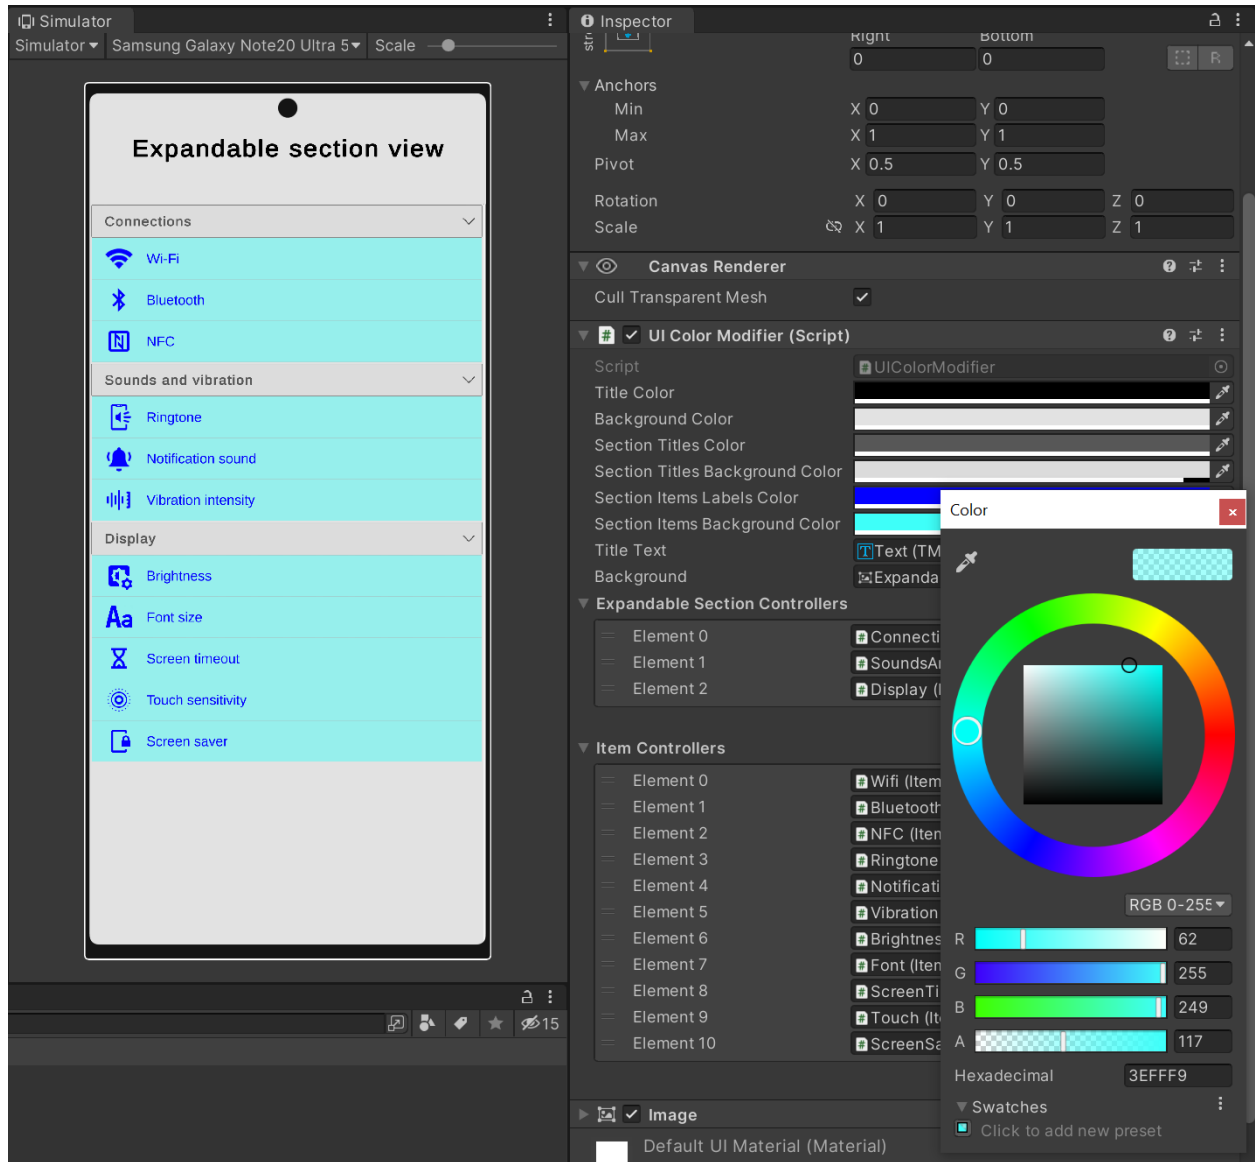

Expandable Section View

- Easily customizable colors
- Animations without Animators
- Initial expanded/collapsed state

Table of contents:

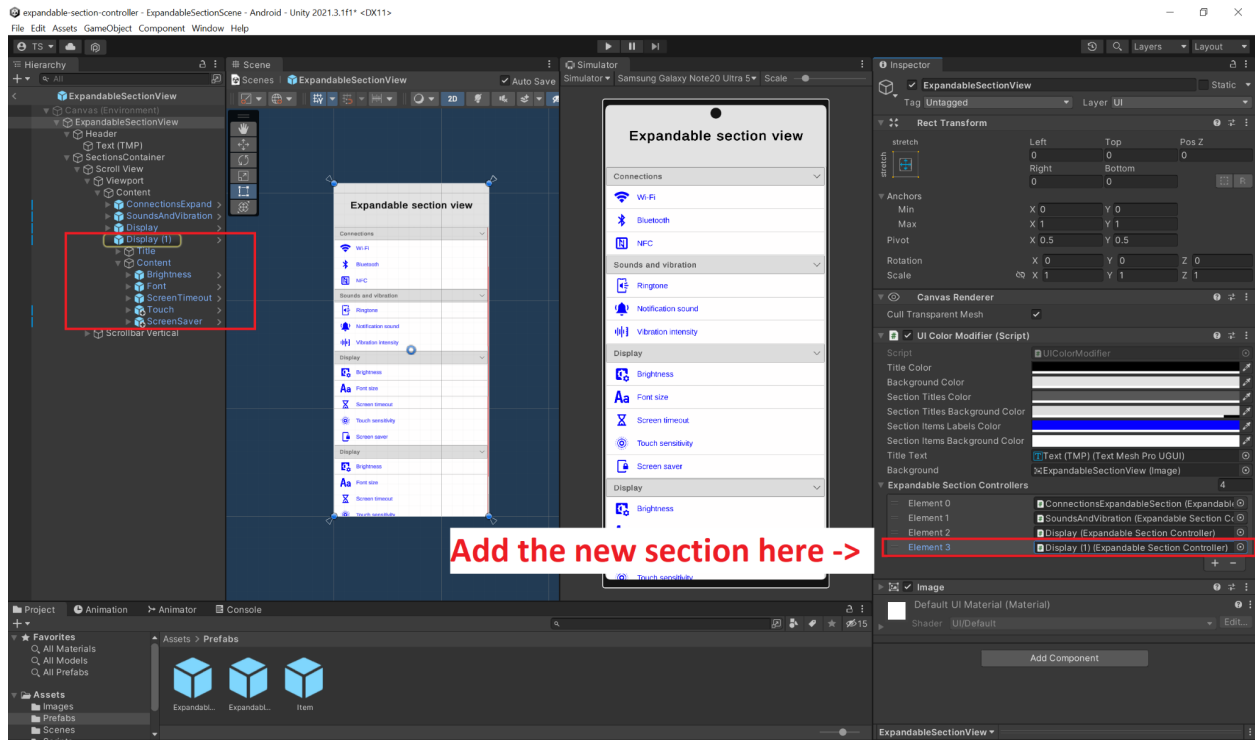

Modify the colors	3
Add a new section	5
Add a new item in section	6
Choose the initial state	7

1. Modify the colors

To modify the colors, open **Prefabs > ExpandableSectionView**. The root element contains a script **UI Color Modifier** with multiple colors at the top. Modify any of the colors - the prefab should change.

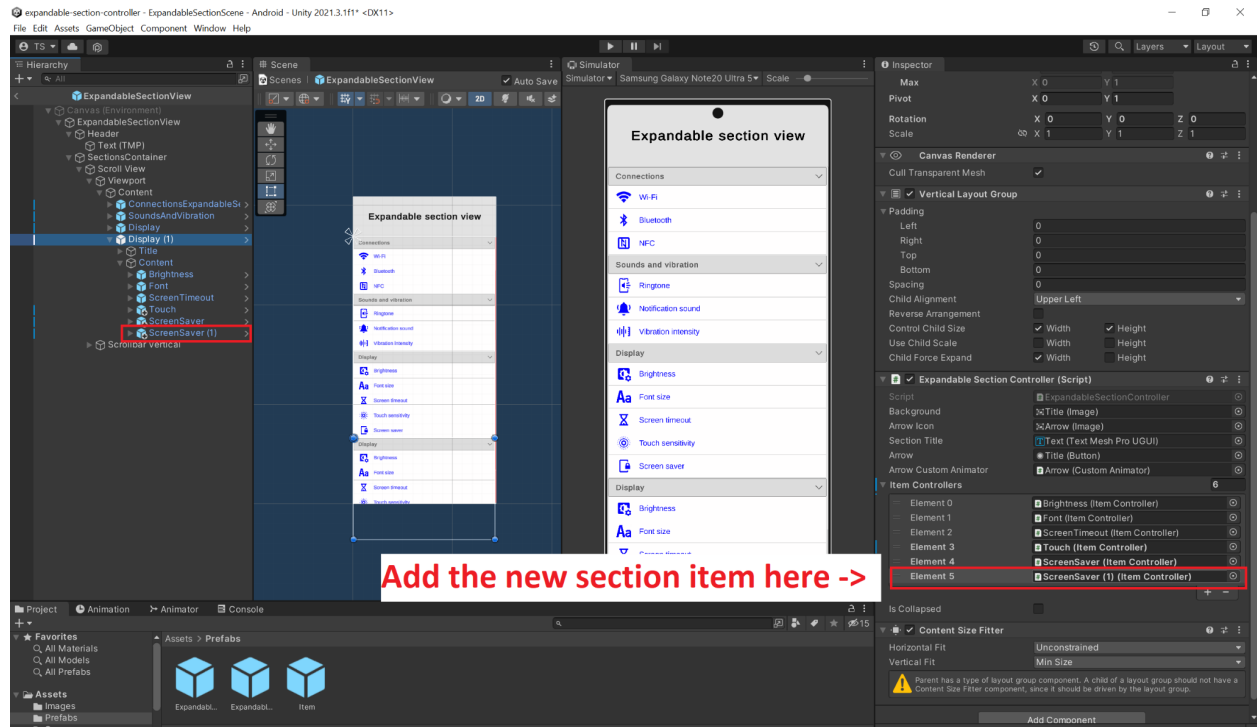

2. Add a new section

To add a new section, open **Prefabs > ExpandableSectionView**. Expand the elements as shown in the screenshot. Expand **Content** and duplicate some of the items. The section should show.

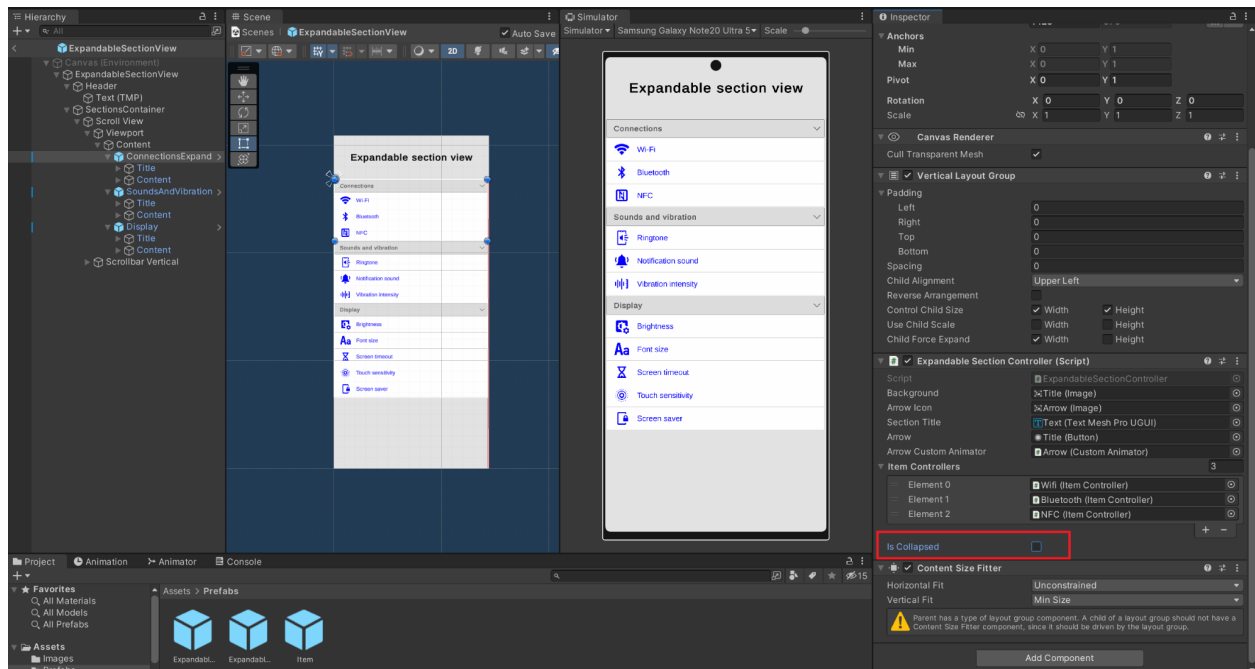

You should now attach it to the **UI Color Modifier** in the root element, as shown above.

3. Add a new item in the section

To add a new item, expand the required section in the prefab. Duplicate some of the elements and modify the values as you wish. You should now attach it to the **Expandable Section Controller**, as shown in the screenshot.

4. Choose the initial state

To choose the initial state of each section, find the **Expandable Section Controller**, attached to the section UI element and check/uncheck **Is Collapsed**, as shown above.
